

Computer Aided Sinus Surgery may be recommended for several patients having difficult sinus problems where it may be beneficial to perform sinus surgery using this method which is usually done for optimal accuracy, Dr. Fadhli is a trained and skilled surgeon with the image guided sinus surgical procedure or Computer Aided Sinus Surgery.

How does it work? Computer Aided Sinus Surgery uses a sophisticated mapping system which combines CT Scans and real time information about the exact position of the surgical instrument. This technique allows the surgeon to precisely navigate through the difficult sinus passages more accuracy. Since the sinuses are physically close to the brain, the eyes and major arteries, accuracy is extremely important during sinus surgery. Image computer aided technology gives the surgeon a more level of precision which is not possible with the traditional sinus surgery. It is also helpful in patients who have had previous surgical procedures and the anatomy of the sinus have been altered.
